1. What is Pintailer?

Pintailer – A Tool that helps the QA Teams migrate from Manual Tests to Automation. The name Pintailer is derived from a migrating Bird named Pintail. Another reason that makes us choose the name is that the Tool identifies the actual statistics of Test Automation that any management needs. Before automation testing Boomed up, the industry used the manual testing approach and most of the companies still have their big repositories of Manual test cases. They are willing to move to the world of automation but one thing that keeps them from doing so is that they do not want to lose their Manual Test Cases as they majorly rely on them. Today we have a lot of tools available in market that helps in Automating the Test cases, those which serves as a repository for both manual as well as automated test cases, but what about the retro fit? Where do we link our existing manual test cases with Automation? In the same old manual excel sheets that are tedious and difficult to maintain?

The answer to all the questions and dilemmas is a tool that helps you keep the manual test cases and an equivalent automation test case - Pintailer. This would help one track which test cases are automated and which are pending as the tool ensures one to one mapping between the manual and the automated test cases. Using the spectacular reports the management can visualize the actual status of the work that is done while migrating from manual to automation. The tool provides a reporting structure that is easy to use and the Test Management can rely on it. So what are we waiting for? Let's start using this tool to achieve contemporary and successful Test Management.

In this tutorial we will study how to use Pintailer.

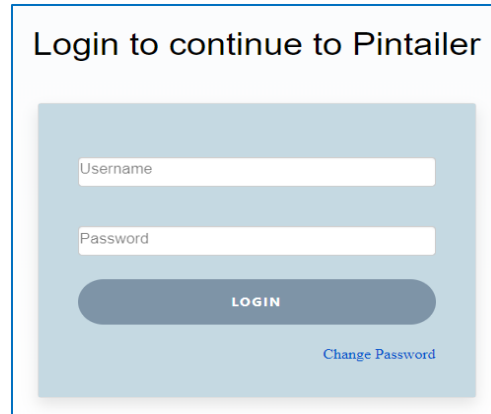

2. Login to Pintailer

To login to Pintailer follow the given steps:

Step 1: Enter a valid "Username" in the Username field.

Step 2: Enter a valid Password using the Password field.

Step 3: Click on "Login" button.

Upon successful login the user will be on the Profile page where they can view their profile.

Note: In case you do not have the Username and Password, then please log a support ticket from [Pintailer Website](#).

3. User Roles

The Users of Pintailer can be assigned with 3 different roles. These roles will have access to different set of sections within Pintailer.

1. **Admin** – Has complete access to view Setup, Reports and Test Definitions and edit Setup and Test Definition sections
2. **Software Testing** – Has access to view/edit Test Definitions section and View Reports section.
3. **Software Development** – Has view only access to the Test Definitions and Reports section.

4. Project Setup

The first thing that is required to start with Pintailer is the Project setup. All the data and reports can be added and viewed only based on the projects created. Using the Project setup page you can set the configurations for the Projects, environment and releases. The Project Set-up is completely role based. The Users would need Admin rights to access this page. So before proceeding make sure that your user has Admin role and on the first login make sure that you are associated with the correct organization.

4.1. Adding and Updating Projects

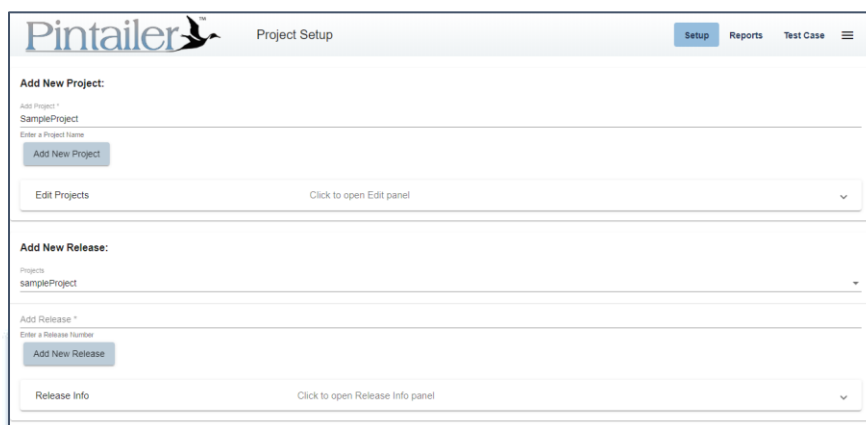

4.1.1. Adding New Project

To Create Projects, click on Project setup present under Setup in the menu. Once the page is loaded follow the steps:

Step 1: Select the Organization (if you are assigned to more than one organization)

Step 2: Enter the "Project Name" in the Add Project text box

Step 3: Click on Add Project button

The New Project will be created and a message will be displayed.

Note: To Add a project the user should have the capability of Setup section.

4.1.2. Viewing Existing Projects

To view an existing project, click on the Edit panel present under "Add New Project:" Upon clicking, the panel will expand and the list of all the available project will be displayed with details like - Project Name, Organization, Created By and Modified By.

Edit Projects

Click to open Edit panel

^

Filter

| Project Name | Organization | Created By | Modified By | Actions |
|---------------|--------------|------------|-------------|-----------------|
| sampleProject | Org4Audying | audy.ing | audy.ing | <div>Edit</div> |

4.1.3. Editing an Existing Project

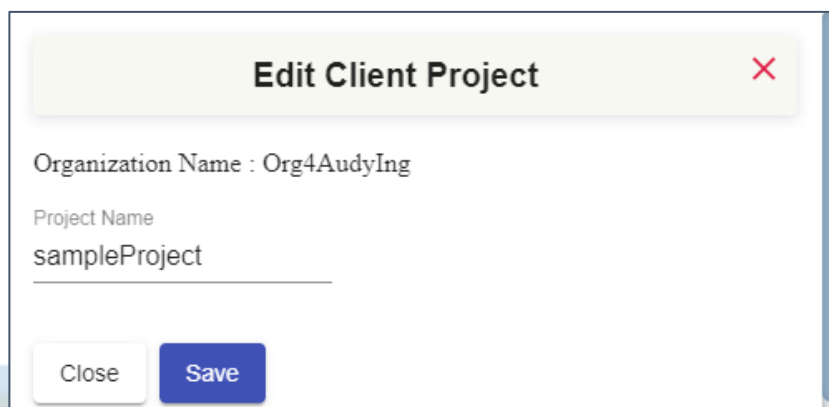

To Edit an existing project, click on the Edit panel present under "Add New Project:" Upon clicking, the panel will expand and the list of all the available project will be displayed. Follow the steps to edit the project

Step 1: Against each project you will find an Edit button, click on Edit button

Step 2: Update the Project name

Step 3: Click on "Save" button

The updated name will be saved and a message will be displayed.

4.2. Adding and Updating Releases

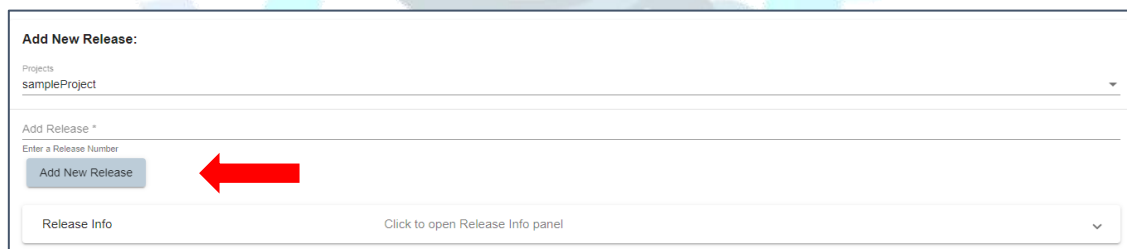

4.2.1. Adding New Release

To create a new Release, click on Project setup present under Setup in the menu. Once the page is loaded follow the steps:

Step 1: Select a Project under which you wish to add a Release

Step 2: In the "Add Release" field enter the "Release Name"

Step 3: Click on Add New Release button

Upon clicking on the button the New Release will be saved and a message will be displayed.

Note: To add a release the user should have the capability of Setup section.

4.2.2. Viewing Existing Release

To view an existing release, click on the Release Info panel present under "Add New Release." Upon clicking, the panel will expand and the list of all the available releases will be displayed with details like – Release Number, Organization and Active Flag.

Add New Release:

Projects
sampleProject

Add Release *
R1

Enter a Release Number
Add New Release

Release Info
Click to open Release Info panel

Filter

| Release Number | Organization | Active Flag | Actions |
|----------------|--------------|-------------|--------------------|
| R1 | | true | Switch Active Flag |

Items per page: 5
1 - 1 of 1

4.2.3. Switching Active Flag for Existing Release

To switch the flag of an existing release, click on the Release Info panel present under "Add New Release:" Upon clicking, the panel will expand and the list of all the available releases will be displayed.

Step 1: Click on the "Switch Active Flag" button

Step 2: Click on "Ok" button in the pop-up

Add New Release:

Projects
sampleProject

Add Release *
R1

Enter a Release Number
Add New Release

Release Info
Click to open Release Info panel

Filter

| Release Number | Organization | Active Flag | Actions |
|----------------|--------------|-------------|----------------------|
| R1 | | true | → Switch Active Flag |

Items per page: 5
1 - 1 of 1

Active flag will be changed and a message will be displayed. By default the release active flag will be "true".

4.3. Adding and Updating Environments

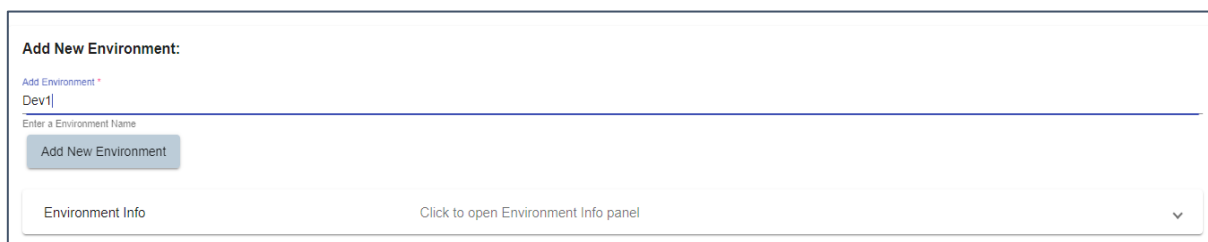

4.3.1. Adding New Environment

To create a new Environment, click on Project setup present under Setup in the menu. Once the page is loaded follow the steps:

Step 1: Select the Organization (if you are assigned to more than one organization)

Step 2: In the "Add Environment" field enter the "Environment Name"

Step 3: Click on Add New Environment button

Add New Environment:

Add Environment *

Dev1

Enter a Environment Name

Add New Environment

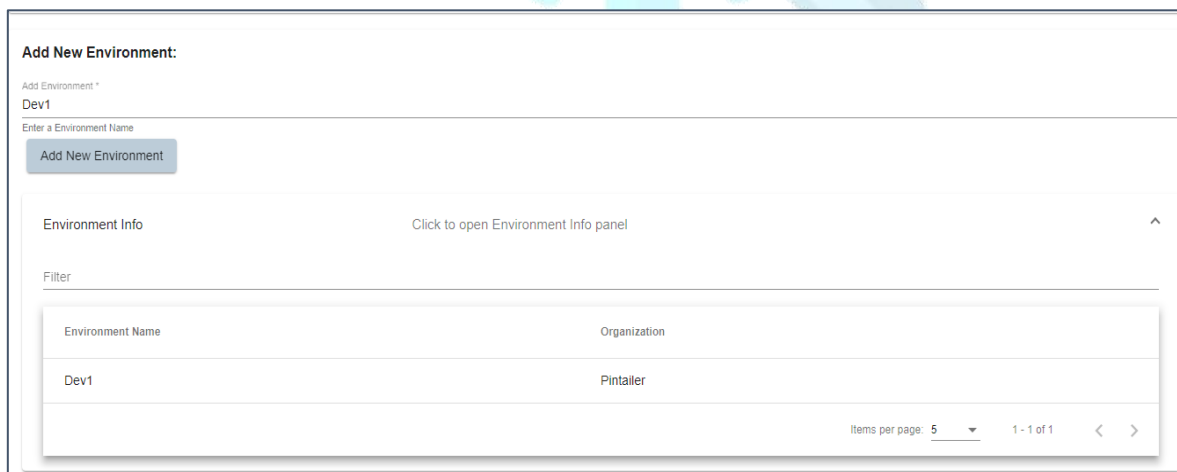

Environment Info Click to open Environment Info panel

Upon clicking on the button the New Environment will be saved and a message will be displayed.

Note: To Add an Environment the user should have the capability of Setup section.

4.3.2. Viewing Existing Environment

To view an existing Environment, click on the Environment Info panel present under "Add New Environment:" Upon clicking, the panel will expand and the list of all the available Environments will be displayed with details like – Environment Name and Organization.

Add New Environment:

Add Environment *

Dev1

Enter a Environment Name

Add New Environment

Environment Info Click to open Environment Info panel

Filter

| Environment Name | Organization |
|------------------|--------------|
| Dev1 | Pintailer |

Items per page: 5 1 - 1 of 1

5. Module Setup

Once the Project is created, the modules needs to be added so that later the Test Cases can be created and associated with the relevant modules. To add the modules follow the steps:

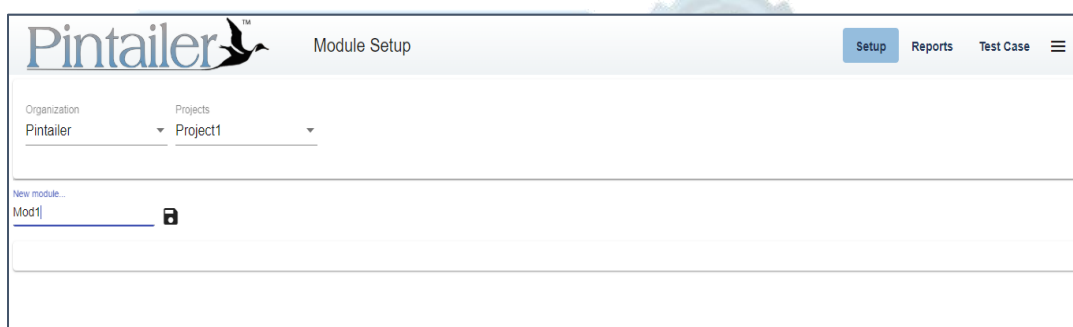

Step 1: To add a new Module, click on Module setup present under Setup in the menu

Step 2: Select Project

Step 3: In the New Module field enter a Module Name

Step 4: Click on the save button next to the field.

The New Module will be added and a message will be displayed.

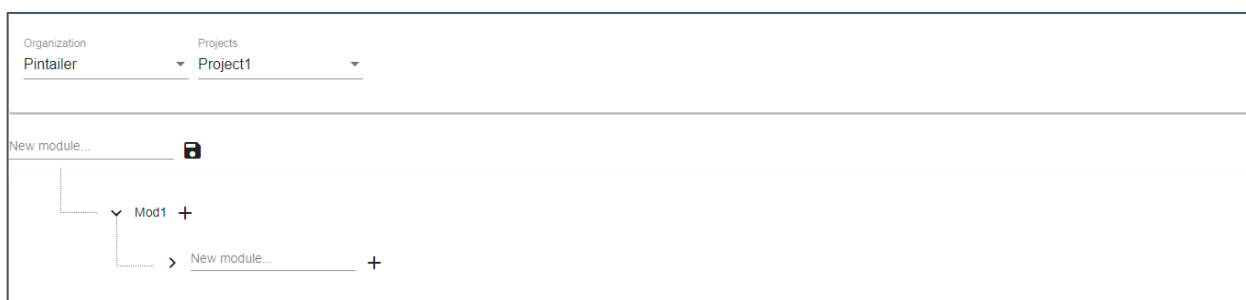

5.1. Creating Sub Modules

The Sub Modules can be created using the following steps under a Parent module:

Step 1: Click on the "+" icon present next to any Module or Sub Module

Step 2: Click anywhere in the UI and the newly added Sub-modules will be saved.

Note: Any number of sub modules can be added in the hierarchy.

6. Test Cases

There are two ways in which a new test case can be added into Pintailer.

1. By creating a new Test Case using the "Add Definition"
2. By Importing Definitions

6.1. Understanding Test Case Template

Before creating or importing Test Cases, let's understand the Fields present in the Definitions as they would be used through out the tutorial from now on.

| Field Name | Purpose |
|-------------------|---|
| TC ID Ref. | A Test Case reference number that would be used to uniquely identify the Test Case. |
| Module Name | Module added in section 4. This will be used to place the Test Cases under Tree Structure. |
| Functionality | Sub-module added in section 4.1. This will be used to place the Test Cases under Tree Structure. This would be considered the intermediate module in the hierarchy. |
| Sub Functionality | Sub-module added in section 4.1. This will be used to place the Test Cases under Tree Structure. This would be considered the lowest module in the hierarchy. |
| Test Summary | Test Summary refers to the objective of the test case. A test summary should be always be unique |
| Pre-condition | Pre-condition refers to any specific steps that needs to be fulfilled before the test case is executed |
| Execution Steps | Step-by-step procedure to execute the test |
| Expected Result | The expected result of the test |
| Actual Result | The actual result of the test; to be filled after executing the test |
| Tester | The name of the author of the test case. |
| Execution Date | The date of execution of the test |
| Test Results | Pass or Fail. Other statuses can be 'Not Executed' if testing is not performed and 'Blocked' if testing is blocked. |
| Test Data | The test data, or links to the test data, that are to be used while conducting the test |
| Linked Defect | The Defect Number needs to be provided here which is being logged when the Test Case Fails. |
| Environment | The Test Environment on which the Test Case was executed |
| Criticality | The priority of the Test Case |
| IsAutomatable | Indicates that the Test Case is Automatable |
| Remarks | Any comments on the test case or test execution. |

| | |
|---------------|--|
| File Name | Name of the file where the relevant automation exists |
| Test Case No. | Test Case Scenario or method name for the Test Case in the automation file |
| Applicable | Indicates whether the Test Case is currently Active or Inactive. |

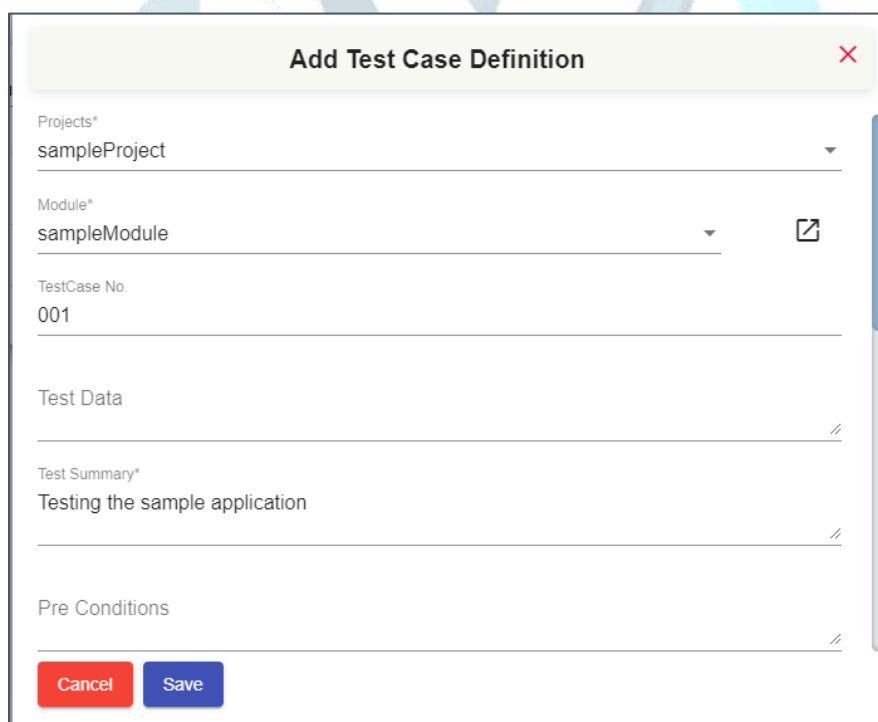

PS: In case you use a template that is extremely different from the one provided by us the please contact us and we can customize the tool as per your preference.

6.2. Creating New Test Cases

To create new Test Cases follow the steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Click on "Add Definition" button
- Step 3: Select Organization, Project and Module
- Step 4: Enter a Test Case Number, Test Summary, Pre-condition, Tag (Priority), Execution Step and Expected Result
- Step 5: Click on save button

The New Test Case will be created and saved into the repository.

Add Test Case Definition

Projects*

sampleProject

Module*

sampleModule

Testing the sample application

Pre Conditions

Cancel

Save

The screenshot shows the 'Test Case Definition' page in the Pintailer application. It includes a header with the Pintailer logo, navigation tabs for 'Setup', 'Reports', and 'Test Case', and a search bar. Below the search bar is a table with columns: 'Test Case ID', 'Module Name', 'Test Case Summary', 'Execution Steps', and 'Expected Result'. Two test cases are listed: one with ID '1' and a green checkmark icon, and another with ID '2' and a yellow hand icon. The table also shows pagination controls at the bottom right.

| Test Case ID | Module Name | Test Case Summary | Execution Steps | Expected Result |
|--------------|--------------|-------------------------------------|--|--|
| 1 | sampleModule | This is a sample test case summary. | | |
| 2 | sampleModule | Testing the sample application | 1. Enter user name. 2. Enter Password 3. Click on Login button | User is logged into the sample application |

6.3. Importing New Test Cases

6.3.1. Prerequisites while Importing Test Cases

There are some basic information or constraints that need to be taken into consideration before we import any new test case in Pintailer:

- If the value of Automatable is marked 'yes', Automated is 'yes' and a "Test Case No." is provided then the test case mapping will be done automatically for TestNG.
- While mentioning the Automation File Name the name format should contain "_" (an underscore). Example: file_name.csv

6.3.2. Importing New Manual Test Cases

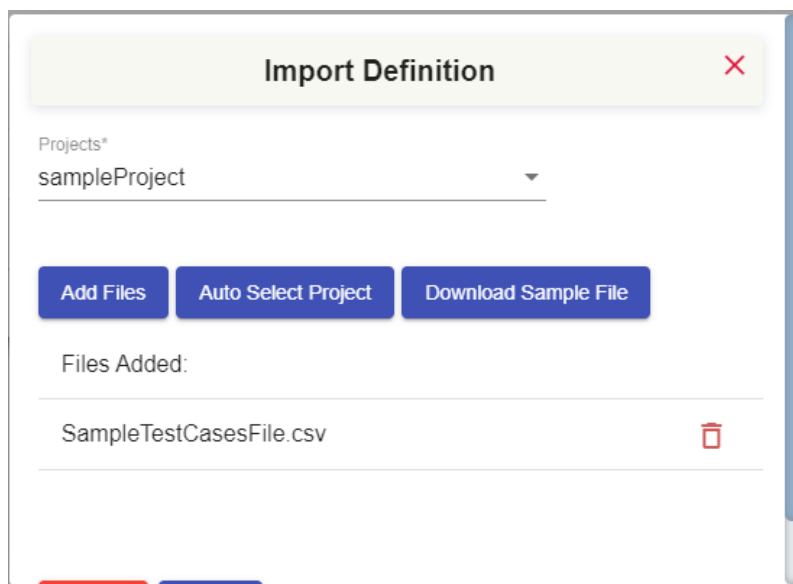

To Import Test Cases in Bulk follow the given steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Click on "Import Definition" button
- Step 3: Download the Sample File
- Step 4: Add all the Test Cases in the file with the Columns filled in as given in Step 5
- Step 5: Enter Module, Functionality, Sub Functionality, Test Case Number, Test Summary, Pre-condition, Tag (Priority), Execution Step and Expected Result
- Step 6: Save the CSV File in your system with the Name format as <Project>_<Filename>.csv
- Step 7: In the "Import Definition" pop-up Select Organization and Project
- Step 8: Click on "Add Files"
- Step 9: Select the Saved CSV file
- Step 10: Click on Upload

The New Test Case will be imported and saved into the repository.

Note: In case there are any discrepancies in the import file all those would be listed out by the system and the file will be uploaded only once.

those are rectified. In case of Duplicate Test Cases, the test cases will not be uploaded

6.3.3. Importing Existing Manual Test Cases with Automation

To Import test cases that have Automation already done follow the below steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Click on "Import Definition" button
- Step 3: Download the Sample File
- Step 4: Add all the Test Cases in the file with the Columns filled in as given in Step 5
- Step 5: Enter Module, Functionality, Sub Functionality, Test Case Number, Test Summary, Pre-condition, Tag (Priority), Execution Step, Expected Result, IsAutomatable, IsAutomated, File Name and Test Case No.
- Step 6: Save the CSV File in your system with the Name format as <Project>_<Filename>.csv
- Step 7: In the "Import Definition" pop-up select Project
- Step 8: Click on "Add Files"
- Step 9: Select the Saved CSV file
- Step 10: Click on Upload

The New Test Case will be imported and saved into the repository.

Automation in TestNG

Here, in case the Test Cases are automated in TestNG then these fields would mark/map the automation for those Test Cases automatically by

just providing Filename, Test Case Number and Automatable/Automated Yes. In Case the automation for the Test Cases would be done in future then these fields can be left blank and would need to be updated manually in Test Case Edit.

Automation in Selenium (Using Cucumber)

If the Automation is done using selenium, then only mentioning the name of the Cucumber feature file in the File Name column and leave the next column "Test CaseNo." Blank.

Note: In case there are any discrepancies in the import file all those would listed out by the system and the file will be uploaded only once those are rectified. In case of Duplicate Test Cases, the test cases will not be uploaded

6.4. Editing Existing Test Cases

The existing test cases can only be edited in the Pintailer's Edit functionality (User will not be able to Import the edited test cases). Follow the steps to edit the existing Test Cases

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Search the existing Test Case.
- Step 3: Right click on the test case and then click on Edit button
- Step 4: Update the fields that needs to be changed.
- Step 5: Click on Save button

The Test Case will be updated and saved into the repository.

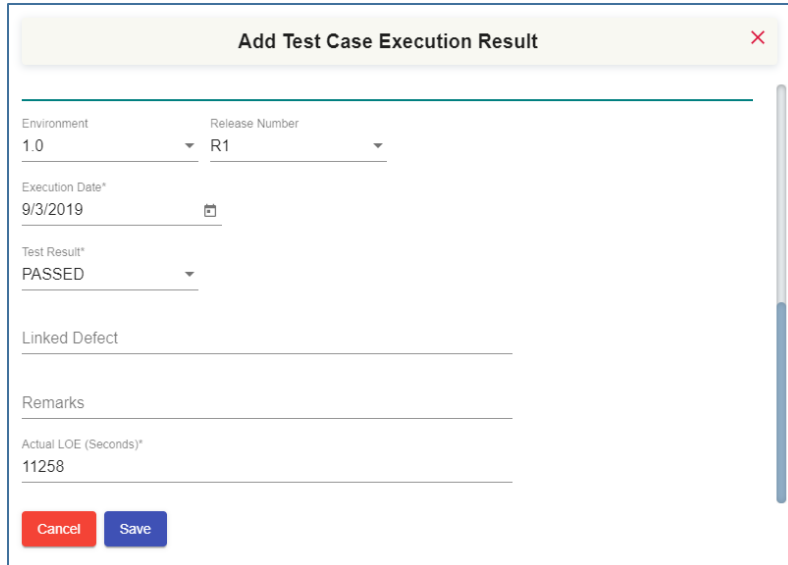

6.5. Updating Manual Execution Results

The existing test cases can be executed manually by the executioner and the results can be updated using the following steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Search the existing Test Case.
- Step 3: Right click on the test case and click on Add Execution Results
- Step 4: Update the "Add TestCase Execution Result" section with the information like Environment, Release Number, Execution Date, Test Result, Linked Defect, Remarks and Time taken to execute test cases.
- Step 5: Click on Save button

The Test Case Results will be updated and saved into the repository.

PS: Make sure that the Release mapping is already done before you update the results.

6.6. Importing Automated Test Files

In Pintailer you can add 3 types of automated test cases

1. Manual Test Cases Automated with TestNG Implementation
Test Cases that are automated using the TestNG framework
2. Manual Test Cases that are automated using Cucumber
Test Cases that are automated using the cucumber framework
3. 100% Automated Test Cases using Cucumber

Another major feature that Pintailer provides is the Automatic Mapping of Automation Test Cases. Many times we observe that there are cases that the Testing is accomplished completely using Automation. In this case there are no counts, scenarios etc. Pintailer provides the user flexibility to just upload their Feature file into the system and a corresponding manual test definition would be created for all the scenario present in the feature file. To utilize this feature please refer the below sections.

There are multiple things that needs to be taken care before the Automated Test Cases are imported into the Pintailer system

6.6.1. Prerequisites while Importing Automation Test Files

Before importing a feature/xml file into the Pintailer system there are some basic rules that needs to be kept in mind.

For TestNG implementation:

- In case of a TestNG Script, to mark the presence of a Test Case, there should be an annotation like "@Test(description =

"ProjectName_JavaFileName :: TestCaseSummary")" which is an annotation mandated by TestNG. This annotation is used by Pintailer to identify the Test Cases present in the script. With this annotation we create the methods for each Test Case. These methods will be considered as the Test Cases

- Example:

```
@Test(description = "LoginPageTest :: TC_00:Login Validation -
Wait for login page to Load Successfully", groups = "P1")
```

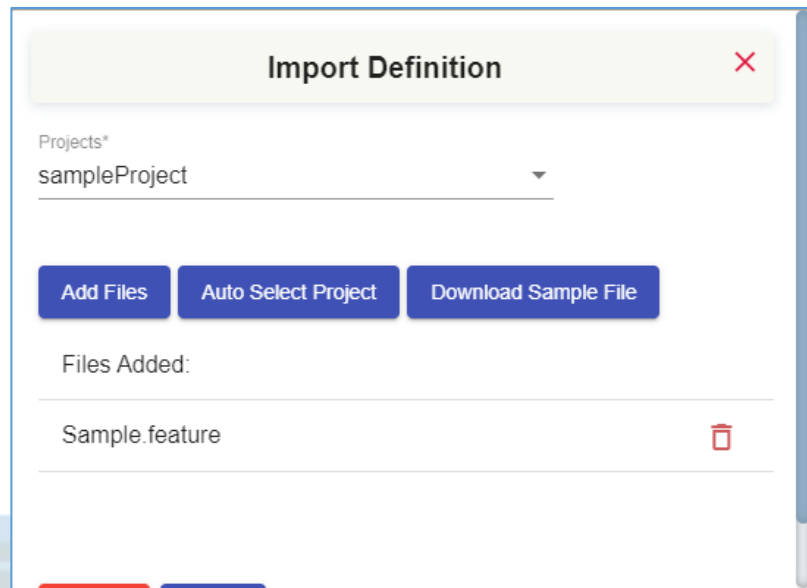

For 100% Automation with cucumber implementation

- In Case of Feature File there should be a comment with the Test Case number and a small description. This way the steps related to the Test Case will be taken as Execution Steps for that test case
- If a statement starts with "##" followed by 'TC<##>: <Description>' it will be considered as a test case.
- Line with '~' will be ignored completely in comments
- If a statement starts with a Keyword then it will be ignored (Note: If any organization wants to set certain words as keywords then please contact the Pintailer support Team.).
- Lines with the keywords Given, When, Then will be inserted in database but will be disabled and will not be displayed on ui until it is enabled

6.6.2. Importing Automation Test Files

To Import Feature files for Automation mapping, follow the given steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Click on "Import Definition" button
- Step 3: Add all the files of .feature or .xml format
- Step 4: In the "Import Definition" pop-up Select Organization and Project
- Step 5: Click on "Add Files"
- Step 6: Select the feature file
- Step 7: Click on Upload

Note: In case there are any discrepancies in the import file all those would be listed out by the system and the file will be uploaded only once those are rectified.

6.7. Importing Test Execution Results

Before importing any file keep these basic rules in mind:

- Date must be in "YYYY-MM-DD HH:MM:SS" format, else import will not be done and discrepancies would be listed out.
- Duration must be provided in seconds
- Test step definition must be provided without keywords
- Test case and Release Id mapping must have been done correctly for getting the correct counts in the Execution Reports. i.e. json, xml and csv will be imported but data will be visible only when the test cases are mapped with release id
- For TestNg - File name with "_" should be provided in import CSV file at the beginning of the description as <FileName> :: <Rest Of the description>

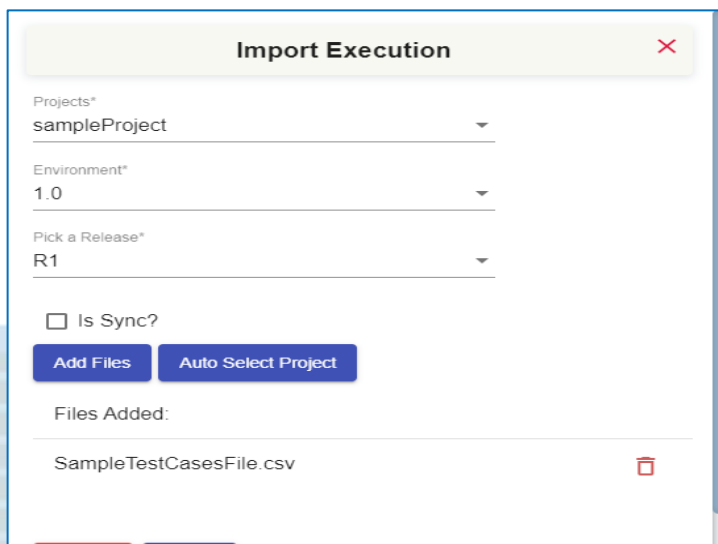

6.7.1. Importing Manual Test Results

To Import manual Test Results follow the given steps:

- Step 1: Click on Definitions present under Test Case from the Menu
- Step 2: Click on "Import Execution" button
- Step 3: In the "Import Execution" pop-up Select Organization, Project, Environment and Release Number
- Step 4: Click on "Add Files"

Step 5: Select the CSV file (Note: The file should be in the format it was uploaded in the tool or it should have been downloaded from the reports section and the Fields corresponding to Execution should be filled)

Step 6: Click on Upload

Note: In case there are any discrepancies in the import file all those would be listed out by the system and the file will be uploaded only once those are rectified.

6.7.2. Importing Automated Test Results

To Import Json/XML files for Automation mapping, follow the given steps:

Step 1: Click on Definitions present under Test Case from the Menu

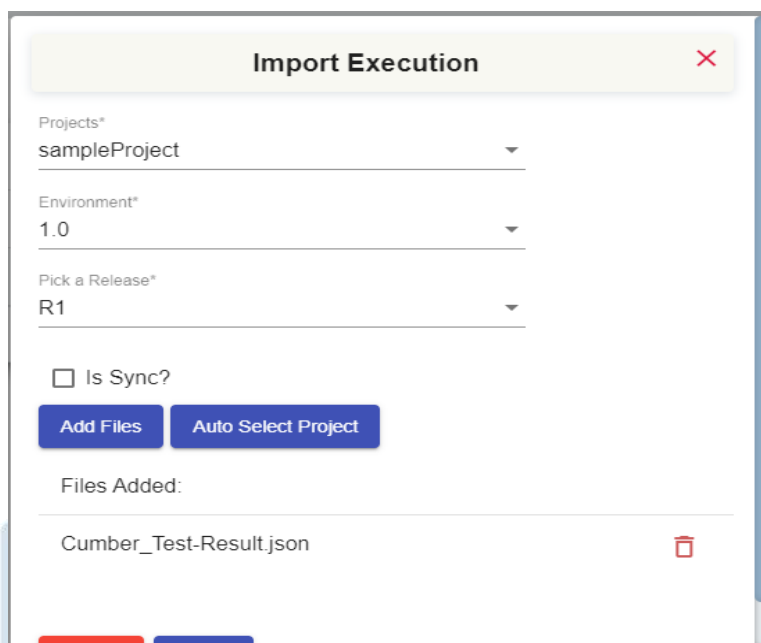

Step 2: Click on "Import Execution" button

Step 3: Add all the files of .json or .xml format that are applicable

Step 4: In the "Import Execution" pop-up Select Organization, Project, Environment and Release Number

Step 5: Click on "Add Files"

Step 6: Click on Upload

7. Test Automation Mapping

Pintailer's core feature is the mapping of Automated Test Cases with their Manual Test Cases. To map the existing manual test cases with their respective automation script, follow the below steps:

Step 1: Click on Automation Mapping present under Test Case from the Menu

Step 2: Select 'Project'

Step 3: Select the Module for Manual Test Case. All the manual test cases present in the selected module will be listed in the left side of the screen

Step 4: Selecting a Release is optional. It will by default be Null.

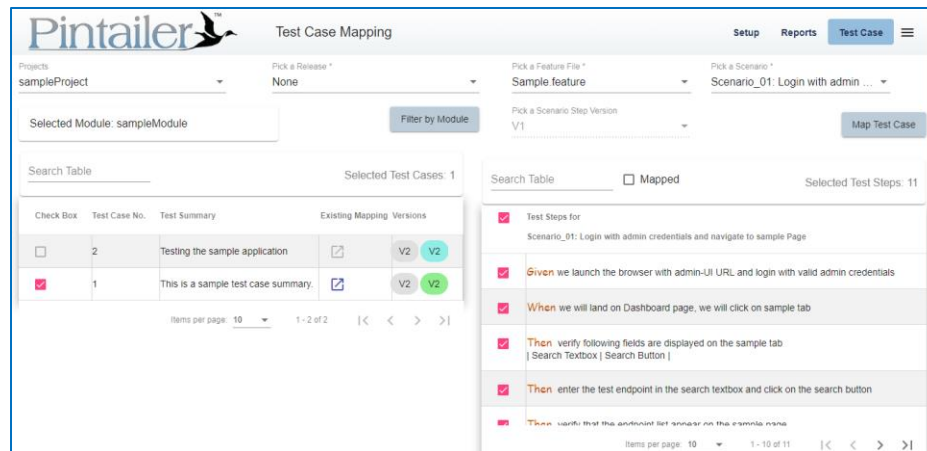

Step 5: From the drop downs present in the Right side, select the Feature File and its corresponding scenario (that contains the automation steps)

Step 6: If there exists multiple versions of the feature file then select the version you want. Else the default selection would be the latest version.

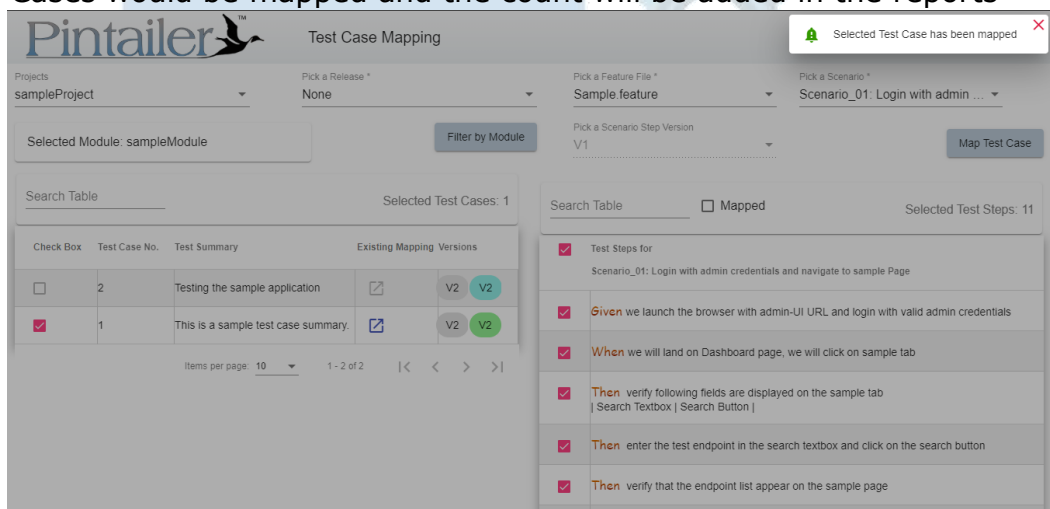

Step 7: Select the Test Case from the left side

Step 8: Select the Steps from the right side

Step 9: Click on Map Test Case button.

Test Cases would be mapped and the count will be added in the reports

8. Edit Feature File

To ease the job of a QA Engineer, Pintailer provides a feature to edit the .feature file within Pintailer application. This would simplify the users job and would enable user to use the latest implemented file to make the changes and also would not disrupt the existing test automation mapping. Once the updates to the feature file is done then the user can export it and use it for implementing the automation steps. To achieve this, follow these steps:

8.1. Editing Existing Steps

- Step1: Click on Edit feature file present under Test Case in the menu.
- Step2: You will be navigated to Edit Feature File page
- Step3: Pick a project from the dropdown
- Step4: Pick a Feature File from the dropdown

Step5: The Feature File will open in the bottom pane. Note: By default the latest version of the Feature file will be opened.

Step6: If you need to modify a step then, go to the step and directly start modifying it. Once the edit is completed.

Step7: Click on Save button.

The colour of the edited line would be changed to yellow

8.2. Adding new Step in an existing feature file

If you need to add a new Step, then go to the step where a new step is supposed to be added and click on the upward or downward arrow to add a step above or below that particular step. The color of the added step will be changed to green. Save the Feature file once the edit is completed.

8.3. Deleting an Existing Step

If you want to delete a step from the existing feature file then click on the Delete icon present next to the step. The deleted step color will be changed to Red. Save the Feature file once the edit is completed.

8.4. Adding/Deleting New scenario in existing feature file

You can add a completely new scenario in an existing feature file. To do this, click on the + icon present next to any scenario and a new scenario will be added after that scenario.

Similarly, if an entire scenario needs to be deleted then click on the delete icon next to the scenario.

8.5. Generating Java Steps

Pintailer provides you with an added feature of generating java steps skeleton for a feature file. To do this click on Generate Java Steps.

If you are fine with the skeleton then you can export the java file by clicking on the "Export Java file" button

8.6. Export Feature file

If you wish you can export any feature file that is present in Pintailer and use it for sending to anyone or to implement the Java test steps. To export the feature file click on "Export feature file"

8.7. Comparing different versions of Feature file

You need not use any third party tool to compare the different versions of feature file. Pintailer provides you with an inbuilt feature that enables you to compare them within Pintailer. To do so follow the steps:

- Step1: Pick a Project
- Step2: Pick a Feature File
- Step3: Select Old Version
- Step4: Select New Version
- Step5: Click on Compare button

The comparison results will be shown in the bottom grid. The colour coding is as follows

| Action | Colour |
|--------------|--------|
| Step Added | Green |
| Step Deleted | Red |
| Step Edited | Green |

9. BDD Editor

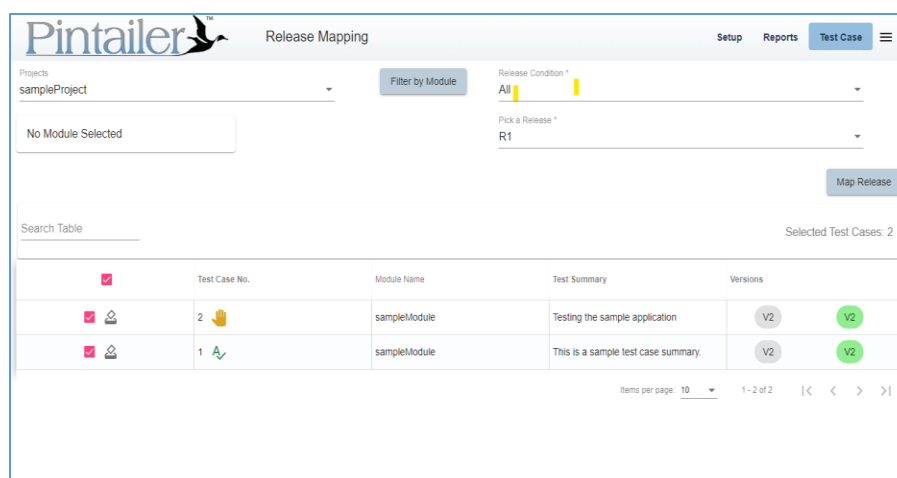

In Pintailer, you can start creating a fresh feature file without worrying about the syntax. Pintailer provides you with a skeleton of syntax. All you have to do is just start by entering the text for the test cases.

Click on the hamburger (3 lines) present at the right corner and then click on BDD Editor. Start updating the feature file and once done you can also create its java skeleton. Once you are ready export the file to use it in your test suite.

10. Test Case Release Mapping

To map the existing test cases to a particular release follow the given steps:

- Step 1: Click on Release Mapping present under Test Case from the Menu
- Step 2: Select the Release Condition Active/Inactive
- Step 3: Select the Release (to which the Test Cases needs to be mapped)
- Step 4: Select 'Organization', 'Project' and 'Module'
- Step 5: All the Test Cases will be listed in the bottom section
- Step 6: Select the Test Cases that needs to be added to the release
- Step 7: Click on 'Map Release' button

The Test Cases will be mapped to the Release and a success message will be shown

11. Reports

There are 3 types of Reports currently available in Pintailer

1. Test Coverage
2. Test Execution and
3. QA Progress

11.1. Test Coverage Report

The Coverage report gives the exact count of Test Cases with their Automation. The report contains 5 fields and its corresponding Graph. This report is very useful for the management as it gives the exact count of test cases that are automated and the count of test cases that are not-automated with its percentage.

| Fields | Definition |
|--------------------|--|
| Total | Contains the Total number of Test Cases that are added onto the selected module |
| Automatable | Holds the count of test cases that could possibly be automated |
| Automation Done | Contains the count of test cases that are automated and its corresponding mapping with manual Test Cases is done in the tool |
| Automation Pending | Contains the count of test cases that are Automatable but are not yet automated and mapped with its corresponding manual Test Case |
| Non-Automatable | Contains the count of Test Cases that cannot be automated |

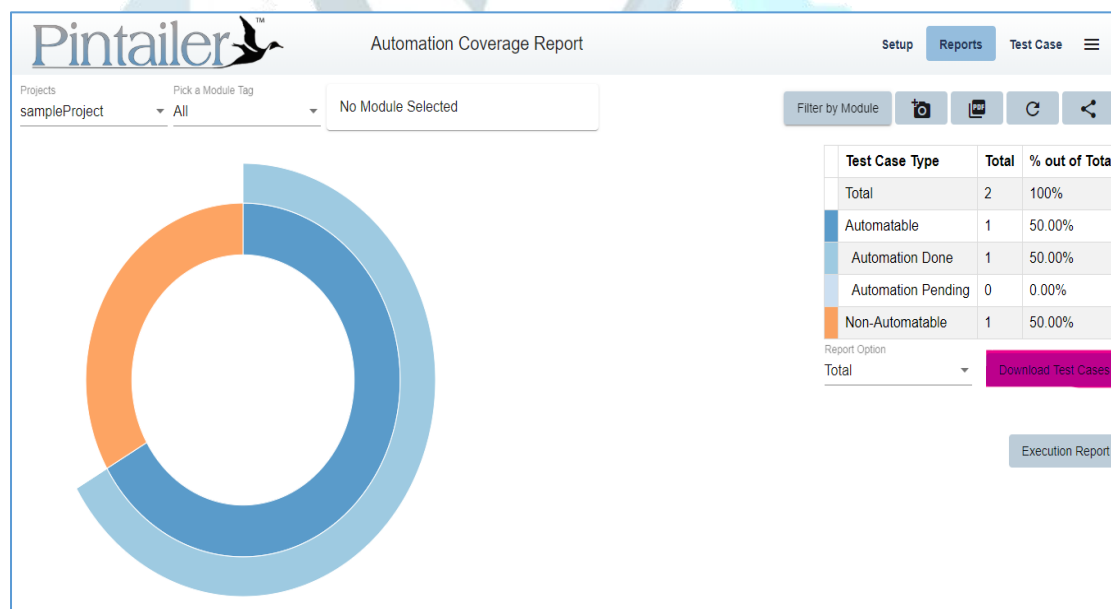

11.1.1. Downloading Test Cases from Coverage Report

To download the CSV of the Total, Automated, Non-automated, Automation Done and Automation Pending Test Cases follow the steps:

Step 1: In the Coverage Report select the Type Test Cases that needs to be downloaded

Step 2: Enter a Name for the File

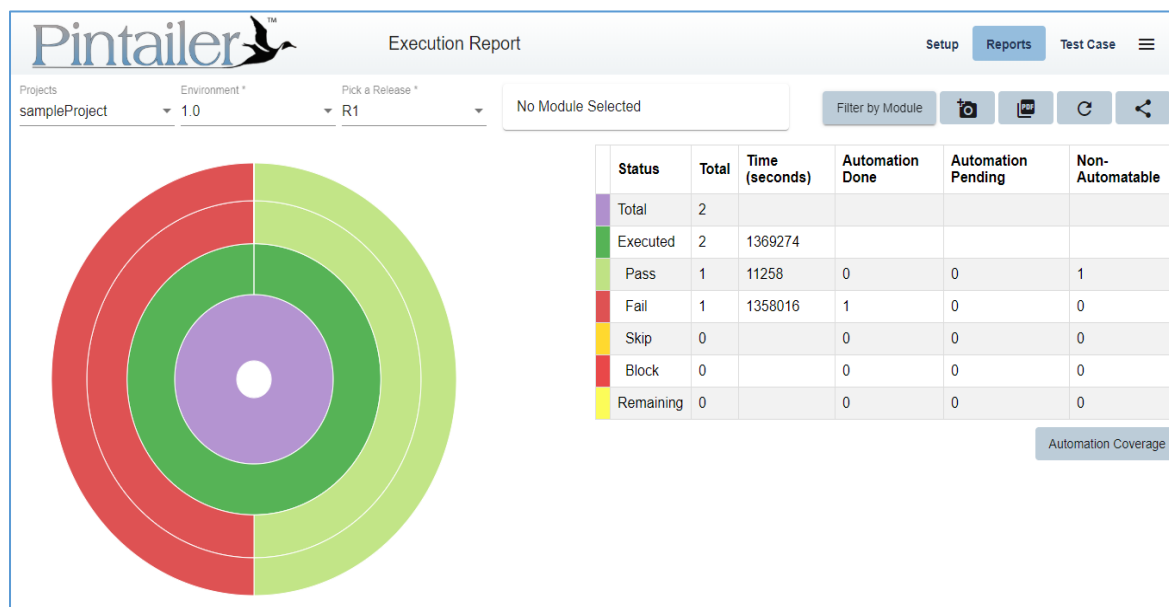

Step 3: Click on Download Test Cases button.

11.2. Test Execution Report

The execution report displays the exact count of the Test Cases that are executed and their corresponding status. The Report also displayed

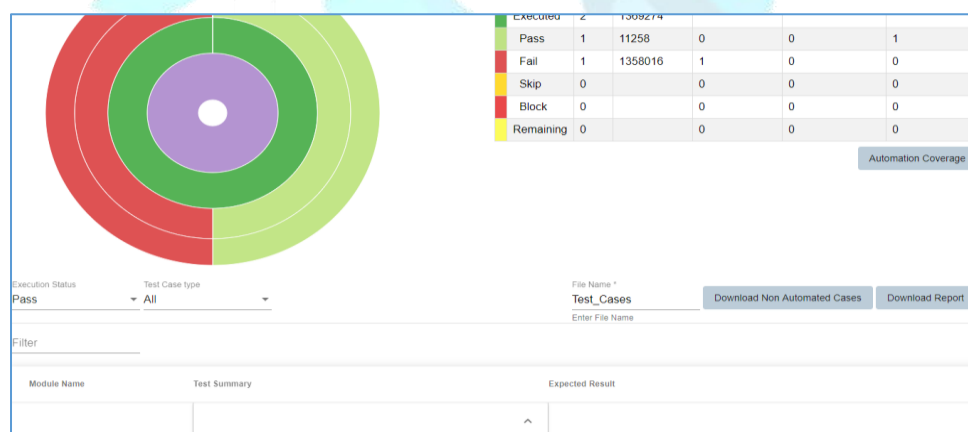

the counts form the coverage report i.e. Under each status how many test cases are automated, non-automated etc

11.2.1. Viewing the Manual Test Cases in the Report

The user has the ability to view the executed test cases in bottom section of the report. To do this user can use any of the following methods:

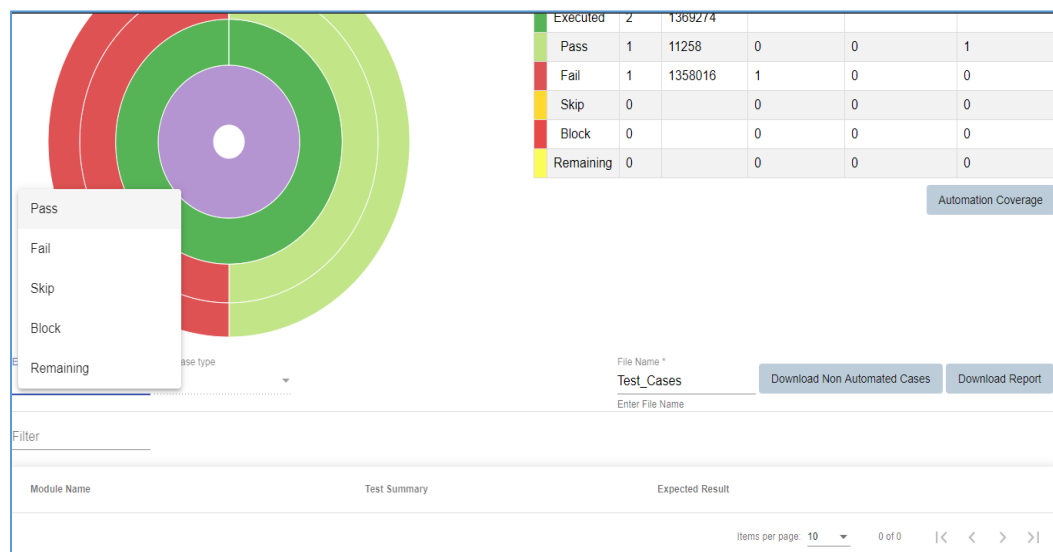

1. By clicking on one of the Execution Results

2. By selecting the Execution Status from the dropdown

For example if a user wishes to see the test cases that are failed then they just needs to Click on the Fail from the table or select Fail form

the Execution status dropdown and the Test cases will be listed in the bottom.

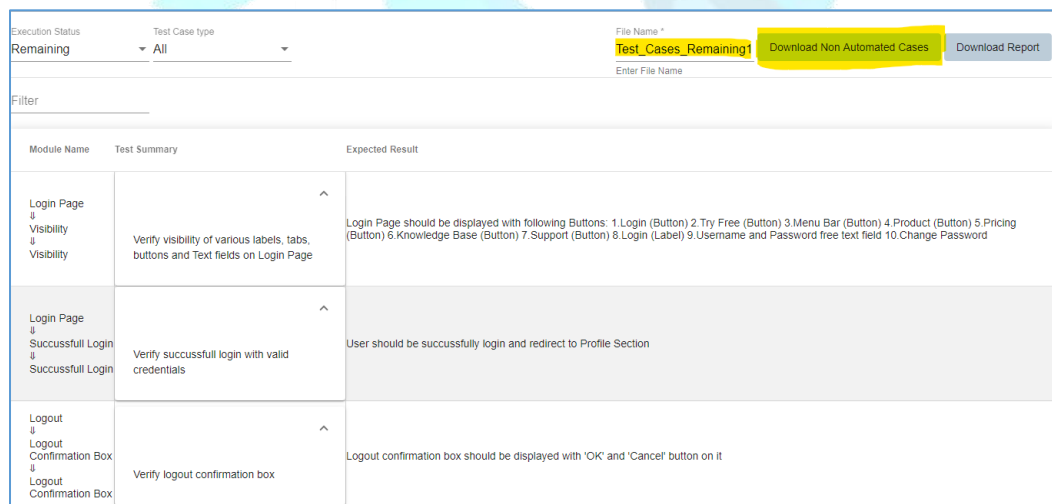

11.2.2. Downloading the Remaining Manual Test Cases

To download the CSV of the remaining Manual Test Cases follow the steps:

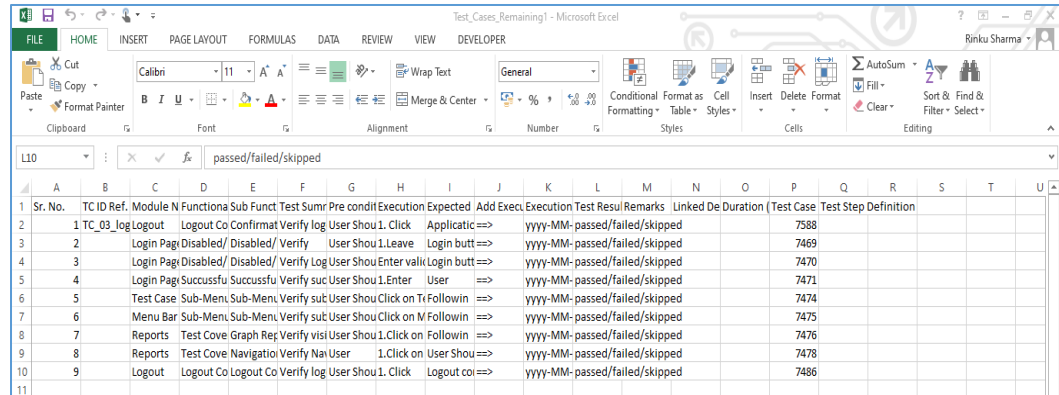

Step 1: In the Execution Report select the Type of Execution Status of the Test Case that needs to be downloaded

Step 2: Enter a Name for the File

Step 3: Click on Download Non-Automated Test Cases.

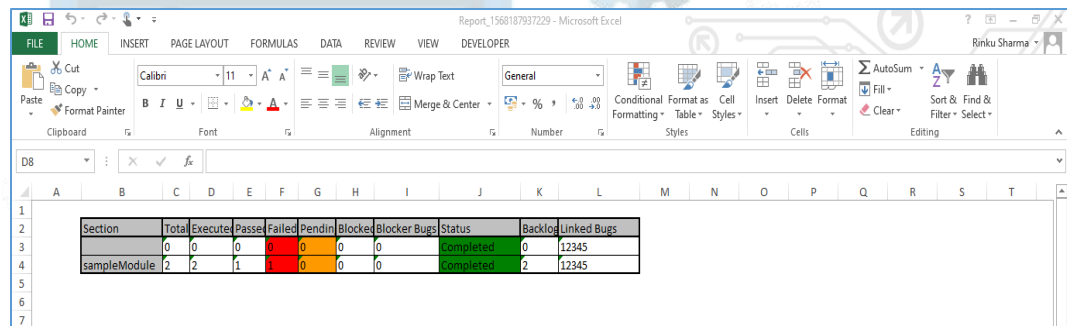

| Module Name | Test Summary | Expected Result |
|--|--|---|
| Login Page ↓ Visibility ↓ Visibility | Verify visibility of various labels, tabs, buttons and Text fields on Login Page | Login Page should be displayed with following Buttons: 1.Login (Button) 2.Try Free (Button) 3.Menu Bar (Button) 4.Product (Button) 5.Pricing (Button) 6.Knowledge Base (Button) 7.Support (Button) 8.Login (Label) 9.Username and Password free text field 10.Change Password |
| Login Page ↓ Successful Login ↓ Successful Login | Verify successful login with valid credentials | User should be successfully login and redirect to Profile Section |
| Logout ↓ Logout Confirmation Box ↓ Logout Confirmation Box | Verify logout confirmation box | Logout confirmation box should be displayed with 'OK' and 'Cancel' button on it |
